## **BONAFIDE CERTIFICATE**

Certified that this Report titled “**AUTOMATED STOCK MONITORING AND NOTIFICATION SYSTEM FOR SUPERMARKET**” is the bonafide work of **DEEPIKA S (927622BEE018), DURGADEVI N(927622BEE028), KAVIN V (927622BEE055), KISHORE S (927622BEE059)** who carried out the work during the academic year (2024-2025) under my supervision. Certified further that to the best of my knowledge the work reported herein does not form part of any other project report.

### **SIGNATURE**

#### **SUPERVISOR**

Mr.M.Ramesh M.E.,  
Assistant Professor  
Department of Electrical and  
Electronics Engineering  
M.Kumarasamy College of  
Engineering, Karur.

### **SIGNATURE**

#### **HEAD OF THE DEPARTMENT**

Dr.J.Uma M.E., Ph.D.,  
Professor & Head  
Department of Electrical and  
Electronics Engineering  
M.Kumarasamy College of  
Engineering, Karur.

Submitted for Minor Project III (18EEP301L) viva-voce Examination held at  
M. Kumarasamy College of Engineering, Karur-639113 on .....

## DECLARATION

We affirm that the Minor Project III report titled “**AUTOMATED STOCK MONITORING AND NOTIFICATION SYSTEM FOR SUPERMARKET**” being submitted in partial fulfillment for the award of **Bachelor of Engineering in Electrical and Electronics Engineering** is the original work carried out by us.

## **VISION AND MISSION OF THE INSTITUTION**

### **VISION**

- ✓ To emerge as a leader among the top institutions in the field of technical education

### **MISSION**

- ✓ Produce smart technocrats with empirical knowledge who can surmount the global Challenges.
- ✓ Create a diverse, fully-engaged, learner - centric campus environment to provide Quality education to the students.
- ✓ Maintain mutually beneficial partnerships with our alumni, industry and Professional associations.

## **DEPARTMENT OF ELECTRICAL AND ELECTRONICS ENGINEERING**

### **VISION**

To produce smart and dynamic professionals with profound theoretical and practical knowledge comparable with the best in the field.

### **MISSION**

- ✓ Produce hi-tech professionals in the field of Electrical and Electronics Engineering by inculcating core knowledge.
- ✓ Produce highly competent professionals with thrust on research.
- ✓ Provide personalized training to the students for enriching their skills.

## **PROGRAMME EDUCATIONAL OBJECTIVES(PEOs)**

- ✓ **PEO1:** Graduates will have flourishing career in the core areas of Electrical Engineering and also allied disciplines.
- ✓ **PEO2:** Graduates will pursue higher studies and succeed in academic/research careers
- ✓ **PEO3:** Graduates will be a successful entrepreneur in creating jobs related to Electrical and Electronics Engineering /allied disciplines.
- ✓ **PEO4:** Graduates will practice ethics and have habit of continuous learning for their success in the chosen career.

## **PROGRAMME OUTCOMES(POs)**

After the successful completion of the B.E. Electrical and Electronics Engineering degree program, the students will be able to:

**PO1: Engineering Knowledge:** Apply the knowledge of mathematics, science, engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.

**PO2: Problem Analysis:** Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.

**PO3: Design/Development of solutions:**

Design solutions for Complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal and environmental considerations.

**PO4: Conduct Investigations of complex problems:** Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid conclusions.

**PO5: Modern Tool Usage:** Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.

**PO6: The Engineer and Society:** Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.

**PO7: Environment and Sustainability:** Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.

**PO8: Ethics:** Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.

**PO9: Individual and Team work:** Function effectively as an individual, and as a member or leader in diverse teams, and in multi-disciplinary settings.

**PO10: Communication:** Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.

**PO11: Project Management and Finance:** Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multi-disciplinary environments.

**PO12: Life-long learning:** Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

#### **PROGRAM SPECIFIC OUTCOMES(PSOs)**

The following are the Program Specific Outcomes of Engineering Students:

**PSO1:** Apply the basic concepts of mathematics and science to analyse and design circuits, controls, Electrical machines and drives to solve complex problems.

**PSO2:** Apply relevant models, resources and emerging tools and techniques to provide solutions to power and energy related issues & challenges.

**PSO3:** Design, Develop and implement methods and concepts to facilitate solutions for electrical and electronics engineering related real world problems.

<b>Abstract (Key Words)</b>	<b>Mapping of POs and PSOs</b>
Supermarket, stock monitoring, sensing signal, send notification	PO1, PO2, PO3, PO4, PO5, PO6, PO7, PO8, PO9, PO11, PO12, PSO1, PSO2, PSO3

## ACKNOWLEDGEMENT

Our sincere thanks to **Thiru.M.Kumarasamy, Founder and Dr.K.Ramakrishnan B.E, Chairman of M.Kumarasamy College of Engineering** for providing extra ordinary infrastructure, which helped us to complete the Minor project in time.

It is a great privilege for us to express our gratitude to our esteemed **Principal Dr.B.S.Murugan M.Tech., Ph.D.**, for providing us right ambiance for carrying out the project work.

We would like to thank our **Head of the Department Dr.J.Uma M.E., Ph.D., Department of Electrical and Electronics Engineering**, for her unwavering moral support throughout the evolution of the project.

We would like to express my deep gratitude to our Minor Project Guide **Mr.M.Ramesh M.E., Assistant Professor, Department of Electrical and Electronics Engineering**, for his constant encouragement, kind co-operation, valuable suggestions and support rendered in making our project a success.

We offer our wholehearted thanks to our Minor project coordinator **Ms.B.Sharmiladevi M.E., Assistant Professor, Department of Electrical and Electronics Engineering**, for her constant encouragement, kind co-operation and valuable suggestions for making our project a success.

We are glad to thank all the **Faculty Members of Department of Electrical and Electronics Engineering** for extending a warm helping hand and valuable suggestions throughout the project.

Words are boundless to thank **Our Parents and Friends** for their constant encouragement to complete this Minor project successfully

## **ABSTRACT**

The Automated Stock Monitoring and Notification System for Supermarkets aims to optimize inventory management by leveraging modern technology. The system integrates ultrasonic sensors, load cells, and a GSM module to provide real-time monitoring and notification services. Ultrasonic sensors measure the distance to items on shelves, ensuring precise stock level detection. Load cells measure the weight of the items to detect any changes in inventory. The GSM module facilitates communication by sending SMS alerts to supermarket staff when stock levels drop below a predefined threshold or when items are misplaced. This system reduces the need for manual inventory checks, ensures shelves are adequately stocked, and enhances overall operational efficiency. By maintaining optimal stock levels, supermarkets can minimize stockouts, improve customer satisfaction, and make informed restocking decisions based on accurate, real-time data. The integration of these technologies not only streamlines inventory management but also provides valuable insights into consumer behaviour through the analysis of stock movement patterns. This data-driven approach helps supermarkets to better understand customer preferences and adjust their inventory accordingly. Ultimately, the system contributes to a more efficient and responsive retail environment, benefiting both customers and store operators alike.

## **PROBLEM IDENTIFICATION**

The main problem that the Automated Stock Monitoring and Notification System solves is the difficulty and inaccuracy of traditional inventory management in supermarkets. In many stores, staff members have to manually check shelves to see if products are running low. This takes a lot of time, effort, and can lead to mistakes. Because of this, restocking can be slow, causing empty shelves and lost sales, which can frustrate customers and hurt the store's earnings. Manual checks can also lead to overstocking, where too many items are ordered, leading to wasted space, higher costs, and possible spoilage, especially with perishable goods. Without accurate and real-time data, it is harder for managers to track sales trends and decide when to restock products. In large supermarkets with many different products, manual monitoring is even harder to manage effectively. The proposed system aims to solve these problems by automating stock monitoring, sending timely alerts when items are low, and providing clear data for better decision-making. This helps stores save time, reduce errors, lower costs, and keep customers happy by ensuring products are always available.

# CHAPTER 1

## LITERATURE REVIEW

### Paper 1

**Title:** Supermarket Shelf Monitoring Using ROS based Robot

**Inference:** This paper introduces a robotic system that automates checking product quantities on supermarket shelves and refilling them when necessary. Traditional shelf monitoring is costly and infrequent, leading to customer dissatisfaction and revenue loss. The system uses a ROS-based autonomous robot for efficient and reliable operation. It utilizes GAZEBO for virtual simulations, G-mapping for navigation and mapping, and OpenCV for image analysis and object detection. This ensures precise monitoring and proactive restocking of shelves.

### Paper 2

**Title:** Research on the Optimization of Supermarket Staff Scheduling Based on Intelligent Algorithm Combined with Binary Coding

**Inference:** This paper delivers into the core problem of supermarket staff scheduling optimization, especially in terms of reducing human resource costs and increasing corporate profits. Genetic algorithm is adopted as the solution method, and the raw data are exhaustively pre-processed and converted into formats at the initial stage. During the application of the genetic algorithm, the Binary 0–1 gene coding method and targeted fitness function were designed. The staff scheduling was successfully optimized through genetic crossover, mutation, and elimination mechanisms. On this basis, employee qualification and efficiency are introduced as new optimization indexes, and the model and fitness function are adjusted accordingly to further enhance the effectiveness of the scheduling scheme.

### **Paper 3**

**Title:** AI-Driven Produce Management and Self-Checkout System for Supermarkets

**Inference:** This paper introduces a deep learning-based system to streamline the purchase and stocking of fruits and vegetables in supermarkets. The proposed system automates the billing process by recognizing and classifying produce, which reduces checkout times and minimizes manual labor. It provides real-time inventory tracking and notifications to ensure timely restocking and minimize waste. Despite potential challenges in recognition accuracy, this approach significantly enhances the shopping experience and operational efficiency, giving supermarkets a competitive edge.

### **Paper 4**

**Title:** Real-time Scene Change Detection with Object Detection for Automated Stock Verification

**Inference:** This paper proposes an automated stock management system using computer vision to reduce manpower in supermarkets. When product levels fall below a set threshold, an SMS or email alerts the relevant authority, aided by an optical character recognition module that identifies the product. An experimental study using a mobile camera as an IP camera demonstrates the system's reliability in a supermarket environment. This approach enhances efficiency and ensures timely product restocking.

### **Paper 5**

**Title:** Use Low-power IoT Cameras to Monitor Store Shelves

**Inference:** This paper proposes using low-power IoT cameras for shelf status detection in large shopping malls. The system replaces manual inspections with cameras that identify when shelves are empty by recognizing specific photos placed on the shelf. It uses an ultralow-power FPGA chip and a CNN model for image recognition. Experimental results show that the system effectively monitors shelves, offering lower costs, low power consumption, and easy maintenance compared to existing solutions.

## CHAPTER 2

### PROPOSED METHODOLOGY

#### 2.1 BLOCK DIAGRAM

fig 2.1 BLOCK DIAGRAM

#### 2.2 DESCRIPTION

##### ULTRASONIC SENSOR

The ultrasonic sensor is used to detect the presence or absence of products on the shelf. If the distance indicates that a product is missing or the shelf is empty, the system triggers a notification for restocking. Ultrasonic sensors measure distance by emitting ultrasonic waves and calculating the time taken for the echo to return. They are widely used in applications like distance measurement, object detection, and robotics. These sensors are valued for their accuracy, reliability, and ability to function in various environmental conditions.

fig 2.2 ULTRASONIC SENSOR

## **LOAD CELL**

Weight sensors, or load cells, measure the force or weight applied to them by converting it into an electrical signal. They are widely used in applications like industrial scales, automotive safety systems, and digital kitchen scales. These sensors ensure accurate weight measurements, improving efficiency, safety, and quality control. Their precise data is crucial for numerous fields, including manufacturing and consumer products.

fig 2.3 LOAD CELL

## **MICROCONTROLLER**

The microcontroller operates by executing instructions stored in its memory. During operation, the microcontroller can interact with external devices or sensors, read input signals, process data, and generate output signals. It can also communicate with other devices or systems using various communication protocols. Overall, the microcontroller operates by executing instructions, interacting with peripherals, and performing tasks based on the programmed code. It's a powerful and flexible platform for building a wide range of applications.

fig 2.4 MICROCONTROLLER

## GSM MODULE

The GSM module in an automated stock monitoring system enables communication by sending and receiving data over the cellular network. It connects to the network using a SIM card and communicates with the microcontroller via AT commands. When stock levels fall below thresholds, the microcontroller triggers the GSM module to send SMS notifications to supermarket staff, ensuring timely restocking. This setup allows for real-time monitoring and efficient inventory management.

## 2.4 HARDWARE KIT

The following figure shows that the automated stock monitoring system for a supermarket. It helps to monitor the stock level and send notification to the user once the stock level is low. With the help of the load cell and ultrasonic sensor, we can easily check the stock levels. Thus, the system helps to reduce need of manual check and also minimizing the risk of stockouts.

fig 2.6 HARDWARE KIT

## 2.5 WORKING PRINCIPLE

This system uses smart technology to streamline inventory management with ultrasonic sensors and load cells tracking stock levels. Ultrasonic sensors measure the distance to items on shelves, while load cells measure their weight, providing accurate inventory data. A microcontroller processes this information and, if stock falls below a set limit, triggers an alert. A GSM module sends an SMS notification to the store manager, avoiding manual checks. The data is also sent to an IoT platform, allowing managers to monitor stock levels and trends online. This system saves time, reduces manual effort, and prevents empty shelves by sending timely alerts, ensuring popular items are always available. By automating stock monitoring, it improves store efficiency and customer satisfaction, combining real-time monitoring, timely alerts, and predictive insights for enhanced inventory management.

## **CHAPTER 3**

### **CONCLUSION**

The Automated Stock Monitoring and Notification System provides a reliable and efficient solution for managing inventory in supermarkets. By using ultrasonic sensors, load cells, GSM communication, the system ensures real-time tracking of stock levels and timely alerts when items need to be restocked. This reduces the need for manual checks, minimizes the risk of empty shelves. This technology-driven approach streamlines store operations, ultimately leading to cost savings and a more seamless shopping experience for customers. By implementing this project, supermarkets can operate more efficiently, improve customer satisfaction, and make better inventory decisions based on accurate, real-time data.

## **CHAPTER 4**

### **FUTURE SCOPE AND ITS IMPLEMENTATION**

The future of automated stock monitoring systems in supermarkets is promising, with advancements in AI and machine learning enabling accurate inventory predictions and ensuring popular products remain in stock. Sophisticated sensors, such as computer vision systems, will improve tracking by visually monitoring shelves and detecting discrepancies in real-time, reducing human error. Blockchain technology will enhance transparency and traceability within the supply chain, ensuring product authenticity and quality control. Enhanced connectivity with smart devices will automate restocking through real-time data sharing with suppliers, leading to seamless retail environments and personalized shopping experiences by analyzing customer data to suggest products and offer discounts. Implementing these systems involves using ultrasonic sensors to measure item distance and load cells to measure weight, providing precise inventory data. A GSM module sends SMS notifications when stock levels drop below thresholds, all connected to a microcontroller, like an Arduino or Raspberry Pi, which processes data and manages notifications. This system reduces manual checks, ensures well-stocked shelves, and improves efficiency and customer satisfaction.
